2007 Indiana Fish Consumption Advisory

Background

We have prepared this booklet to support fishermen and those who like to eat fish by providing helpful information to make healthy choices. Fishing and eating fish from Indiana waterways can be safe and fun if you follow the suggestions on the following pages. In addition to describing healthy eating of sport-caught fish, interest has increased over the years about consuming commercial and farm-raised fish. We have therefore, included information in the Advisory.

The Indiana State Department of Health (ISDH), Indiana Department of Natural Resources (DNR), and the Indiana Department of Environmental Management (IDEM), with support from Purdue University, collaborate to produce this annual *Indiana Fish Consumption Advisory*.

The Advisory is based on the statewide collection and analysis of fish samples for long-lasting contaminants found in fish tissue, such as polychlorinated biphenyls (PCBs), pesticides, and/or heavy metals (e.g., mercury). Samples were taken from fish that feed at all depths of the water, predatory and bottom-feeding.

Well over 200 Indiana water bodies have been tested for fish contaminants through the years. Because testing is expensive, the focus of samples generally is to:

- ♦ Check water with known or suspected pollution sources
- ♦ Check lakes susceptible to mercury contamination
- ♦ Check waters where long-term contaminant trends are tracked

Criteria for the 2007 *Indiana Fish Consumption Advisory* were developed from the Great Lakes Sport Fish Advisory Task Force.

We have condensed this booklet to include only the most important points about sport fishing and fish consumption (including sport and commercial fish). **We also removed most Group 2 fish from the tables, since the Guidelines on page 2 of the Advisory state "that a person should assume any fish you catch is a Group 2..." if it is not specifically listed.**

Using the Advisory

It may not be legal to catch and keep all sizes of fish that we have included in this Advisory.

Please refer to the DNR's Indiana Fishing Guide for information about the legal size limits and number of fish that can be caught based upon the species of fish. Turn to page 24 in this Advisory to find out how to obtain a copy of the Indiana Fishing Guide, or log on to DNR's Web site at: www.IN.gov/dnr/.

Carefully read the instructions below, since meal advice depends upon the species and size of fish.

1. Measure the fish from the tip of the nose to the end of the tail fin.
2. Find the table that includes your fishing site. Look for the symbol showing the type of contaminant and the size of the fish that you caught. If there is no listing for the size of fish, keep in mind that larger fish are likely to be as contaminated, or more, than any that were tested. If you do not find the species of fish in the Advisory, then assume that the fish is in a Group 2 advisory.
3. While fish may have been tested for more than one contaminant, the symbol indicates the contaminant of greatest concern.

Guidelines to Reduce Your Risks

Follow this guidance:

☞ **Use the groupings** in the Advisory to determine the number of fish meals you can eat in a week or month.

☞ **Assume that any fish you catch is a Group 2** if it is not listed or the site where you are fishing is not listed in the Advisory.

☞ **Eat smaller, less fatty fish** like pan fish (bluegill, perch, and crappie).

☞ **Remove fat near the skin of the fish prior to cooking** and **broil, bake, or grill fish** so the fat drips away.

☞ **Eat at least 2 servings (3-4 ounces/serving) of fish per week** (see page 5 for more information).

Risk Comparisons Risk of Death		
Estimated Advisory Group	Level of Risk (chances out of 1,000)	Activity
Level 5	35-125	Smoking 1-2 packs of cigarettes per day
	7-30	Having 200 chest x-rays per year
	5-30	Eating one 10-oz. meal per week of Group 5 fish
	17	Driving a motor vehicle
Level 4	11-12	Eating one 8-oz meal per week of mixed Great Lakes salmonids at 1984 contaminant levels
Level 3	3-6	Eating one 8-oz meal per week of mixed Great Lakes salmonids at 1987 contaminant levels
Level 2	0.1-6	Breathing air in the U.S. urban areas at early 1980's contaminant levels
	3.5	Recreational boating
	1-2	Drinking one 12-oz. beer per day
	1.5	Recreational hunting
	0.014	Complications from an insect bite or sting

Health Risks & Benefits from Eating Sport & Commercial Fish

General Health Risk

Your risk of getting cancer from eating contaminated fish cannot be predicted with certainty. Currently, cancer affects about 1 out of every 4 people by the age of 70, primarily due to smoking, diet, and hereditary risk factors. Exposure to contaminants in fish you eat may not increase your cancer risk at all. If you follow this Advisory over your lifetime, you should be able to lower your exposure, thus reducing your cancer risk from contaminants in fish.

Fish provide a diet high in protein and low in saturated fats when properly prepared. Many doctors suggest that eating one-half pound (8 ounces/ uncooked) of fish each week is helpful in preventing heart disease. Almost all fish may provide health benefits, since fish often replaces a high-fat food in the diet.

Since fish species differ in diet, habitat, growth rate, and physiology, they build up contaminants in their bodies at different rates. Long-term effects of human exposure to PCBs and pesticides have not been fully determined by health experts. People who regularly eat sport fish, including women of childbearing age and children, are particularly susceptible to contaminants that build up in the body over time. Because contaminants may produce harmful effects when consumed over a period of time, the Indiana State Department of Health (ISDH) advises that intake of these fish be limited. (See page 5.)

Contaminants in Fish

Polychlorinated biphenyls (PCBs), pesticides, and mercury collect in the soil, water, sediment, and in microscopic animals. They build up in greater amounts in larger, older fish and in predatory fish (fish that eat other fish). Contaminants are not usually found in smaller panfish such as bluegill and crappie.

Once in a lake, mercury is changed into methylmercury by bacteria and other processes. Fish absorb methylmercury from their food and it is tightly bound to the fish's muscles. There is no method of cooking or cleaning fish that will reduce the mercury.

PCBs and pesticides tend to be stored in the fat of fish, especially fatty fish such as carp and catfish. Unlike mercury, cleaning and cooking a fish to remove fat will lower the amount of PCBs in a fish meal. Most of the fat is located near the skin of the fish.

Eating a boneless, skinless fillet, with the fat layer along the belly flap and the midpoint of the back removed, will limit the amount of fat consumed.

PCBs and methylmercury build up in your body over time. It may take months or years of regularly eating contaminated fish to accumulate levels that are a health concern. If you follow this Advisory, the amount of methylmercury you take into your body is safely eliminated over time. Larger amounts of methylmercury may harm your nervous system. An unborn child is especially at risk of mercury poisoning.

Men typically face fewer health risks following exposure to contaminants. However, animal studies have also shown that mercury can damage sperm, which could result in fertility problems.

The Advisory advice for PCBs is intended to protect children from developmental problems. PCBs also cause changes in human blood, and in the liver and immune function of adults. The meal advice for PCB-contaminated fish is based on the developmental delays that have been measured in infants. It is difficult to say what other effects PCBs may have on anglers and their families, but PCBs cause cancer in laboratory animals and may cause cancer in humans.

Purchased Fish

People often ask about the levels of contaminants in fish bought in stores or restaurants. The U.S. Food and Drug Administration (FDA) sets tolerance levels for contaminants to regulate the interstate sale of fish. Recently, the FDA and the U.S. Environmental Protection Agency (EPA) issued fish consumption advice for women (of childbearing age) and children about commonly eaten commercial fish species. The FDA/EPA advice recommends that up to 12 ounces of fish that are low in mercury be eaten per week to gain the health benefits from fish and shellfish.

Please see the FDA/EPA Consumer Advice for more information and to determine which commercial fish species are safest. Their Web site is: <http://www.cfsan.fda/admehg3.html>

Because fish bought in a store or restaurant do not come with labels that tell you the contaminant levels or even where the fish came from, it is up to the consumer to ask about the source of the fish. In addition to checking the FDA/EPA advice, it is important to eat a variety of fish species to make certain that you benefit the most from fish.

The *Commercial Fish Consumption Table* (page 5) separates two types of canned tuna into different categories by the amount a person can eat. "Light" tuna is made from young fish, while "white" tuna like albacore comes from older fish that have higher levels of mercury. When choosing canned tuna, "light" tuna is lowest in mercury but is also lower in the "healthy" fats found in fish.

Fish sticks from the grocery, fast-food sandwiches, or restaurant-prepared fish most often come from pollock, which is low in mercury.

Recent studies have discussed the levels of contaminants in farm-raised salmon versus wild salmon. Wild salmon have been shown to have very low levels of contaminants. While farm-raised salmon are said to have "significantly" higher levels than wild salmon, these levels of contaminants are still NOT high enough to be of serious concern. Farm-raised salmon are actually slightly higher in "helpful" omega-3 fatty acids than wild salmon.

There may be times when friends and family catch fish that you may want to eat. If there is no advice about how much you can eat, then assume it is a Group 2. (Refer to page 5 of this Advisory.) This means eating no more than 8 ounces (before cooking) in one week.

It is also likely that, at some point, you may eat more fish and shellfish in one week than you ordinarily would. There is little change in the level of methylmercury in that short period of time. Just lower the amount of fish that you eat over the next couple of weeks.

Advisory Groups

The chart on page 5 explains the fish groupings used throughout this Advisory to help in choosing the amount and type of fish that are safe to eat. Additionally, a list of fish species affected by "mercury" on a statewide basis has also been added to this chart.

For certain waters, more or less restrictive advice is needed, because fish have been found to contain higher or lower levels of mercury or PCBs. Please check the tables on pages 8-22.

Carp Advisory for all Indiana Rivers and Streams

Generally, carp are contaminated with PCBs. *Unless noted otherwise, carp in all Indiana rivers and streams fall under the following risk groups:*

Carp	15-20 inches	Group 3
Carp	20-25 inches	Group 4
Carp	over 25 inches	Group 5

Group 5 Waterways

All fish from the following waters are in the Group 5 advisory due to the high levels of contaminants.

DO NOT EAT ANY FISH CAUGHT IN THESE WATERS:

Clear Creek, Monroe County

Salt Creek, Downstream of Clear Creek in Monroe County and Lawrence County

Pleasant Run Creek, Lawrence County

Elliot Ditch, Tippecanoe County

Wea Creek, Tippecanoe County

Grand Calumet River/Indiana Harbor Canal, Lake County

Kokomo Creek, Howard County from U.S. 31 to Wildcat Creek

Wildcat Creek, Downstream of the Waterworks Dam in Kokomo through Howard and Carroll Counties

Little Mississinewa River, Randolph County

Little Sugar Creek/Walnut Fork, Montgomery County

Sugar Creek, Montgomery County (I-74 to SR-32)

Stony Creek, Hamilton County

Advisory Groups of the Indiana Fish Consumption Advisory	
Group 1	Unrestricted consumption. One meal per week for women who are pregnant or breast-feeding, women who plan to have children, and children under the age of 15.
Group 2	Limit to one meal per week (52 meals per year) for adult males and females. One meal per month for women who are pregnant or breast-feeding, women who plan to have children, and children under the age of 15.
Group 3	Limit to one meal per month (12 meals per year) for adult males and females. Women who are pregnant or breast-feeding, women who plan to have children, and children under the age of 15 <u>do not eat.</u>
Group 4	Limit to one meal every 2 months (6 meals per year) for adult males and females. Women who are pregnant or breast-feeding, women who plan to have children, and children under the age of 15 <u>do not eat.</u>
Group 5	No consumption (DO NOT EAT).

[IMPORTANT NOTE: For more detailed information, especially for the at-risk population, please review the 2006 Safe Eating Guidelines for Selected Sport Fish from Most of Indiana's Inland Waters.](#)

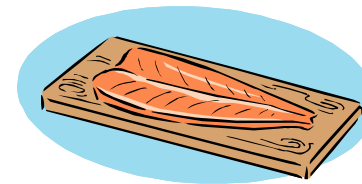

Commercial Fish Consumption*	
Fresh or canned salmon; shellfish like shrimp, crab, and oysters; tilapia; herring; canned "light" tuna; scallops; sardines; pollock; cod; and catfish	Unlimited for all adults One meal per week **
Canned albacore "white" tuna (6 oz.), tuna steak, halibut, and lobster	1 meal per week for adults One meal per month**
Shark, swordfish, tile fish, king mackerel	1 meal per month for adult males and females Do not eat**

2. Choose Wisely 2004, Wisconsin DNR
3. An Expectant Mother's Guide to Eating Minnesota Fish, 2004

**Consumption guidelines for the at-risk population: women of childbearing years, nursing mothers, and all children under the age of 15 years.

A meal is 8 ounces (before cooking) of fish for a 150-pound person, or 2 ounces of uncooked fish for a 40-pound child. Tip: Subtract or add 1 ounce of uncooked fish for every 20 pounds of body weight.

Health Benefits

A 2002 touchscreen survey* conducted for the ISDH showed that **nearly 44 percent of Indiana residents eat little, if any, fish, whether commercially purchased or recreationally caught.** For this reason, the most important message the ISDH wants to share is, "Include fish as a part of your regular diet." The key to gaining the most health benefits from fish is to eat a variety of fish that are low in contaminants. (See pages 3 and 5.) Unlike women of childbearing age and young children, most men and postmenopausal women can eat moderate amounts of fish without being harmed by contaminants. Fish provide a high-protein, low-fat food, which is low in saturated fats. Many researchers suggest, and nutritionists recommend, that consuming 6 ounces of fish a week is beneficial in preventing heart disease.

It is important for people to continue eating fish, including salmon, whether or not it is farm-raised or wild, but at levels that are recommended by the ISDH to maximize benefits and minimize risks.

The health benefits gained from eating either farm-raised or sport-caught fish may far outweigh the risks associated with the low levels of contaminants found in these fish or the choice of eating no fish.

Fish of almost any species, lean or fat, may have substantial health benefits when they replace a high-fat food in the diet. Nutritionists recommend eating at least 2 servings (2-3 ounces/serving) per week. **Three ounces of cooked fish is about the size of a deck of cards.**

The information on the Grouping table for Indiana sport fish and the commercial Fish Consumption table (page 5) helps to provide safe and healthy choices.

*Indiana State Department of Health's *Fish Consumption Advisory Booklet Survey*, Survey of America, Aug-Sept. 2002

Commonly Asked Questions

What are PCBs?

PCBs are synthetic oils that were once widely used in electrical transformers and capacitors. PCBs break down very slowly in the environment.

What is mercury?

Mercury is a naturally occurring metal that does not break down but cycles between land, water, and air. Some mercury that reaches Indiana waters occurs naturally. Mercury is also released from coal-burning power plants and from burning household and industrial waste.

How can I tell if a fish is contaminated?

Contaminated fish may not smell, taste, or look different, but they can still pose an increased risk to anyone who eats them. This is especially true for pregnant mothers and their fetuses, babies, and children. The Fish Advisory informs you about which fish are contaminated.

What about pay-to-fish lakes?

Generally, fish caught in pay lakes are safe to eat. The ISDH recommends that consumption be limited to no more than one meal per week. (See page 5 to define a meal.)

Parasites and Tumors in Fish

Parasites

Anglers sometimes catch fish that contain worms, grubs, cysts, or lumps in the flesh. When cleaning fish, anglers may notice worms in or around the intestines of the fish or fungus growths on the skin, fins, or gills. These fish parasites are a normal part of the ecosystem in which the fish lives. While not nice to look at, the edible parts of the fish that have parasites can be eaten, provided they are thoroughly cooked.

Some of the most commonly seen parasites of fish are black spots, yellow grubs, and tapeworms. Most fish have parasites, and they seldom affect the well-being of the fish except under unusual conditions. **Parasites in fish are only a problem when fish are not thoroughly cooked or are eaten raw.**

Black Spot

Black spot is caused by a parasite called a fluke, which burrows into the skin of fish. The black pigment (about pinhead size) forms in the tissue surrounding the fluke and is a fish's reaction to the parasite. The fluke itself is actually a whitish color.

Yellow Grub

Yellow grubs are also caused by a fluke, which penetrates the skin of fish and curls up into a sac under the skin or in the muscle where it grows to be the grub. The grubs are often found in the flesh of fish near the dorsal fins. When freed from the sac, the grub may be up to ½-inch long.

Tapeworms

Young tapeworms are common in the organs and body cavity of many fish. They usually live in the internal organs of the fish. They resemble long, thin ribbons about 1/16-inch wide.

Tumors

Occasionally, anglers catch fish with external growths, tumors, sores, or other lesions. Such abnormalities generally result from viral or bacterial infections. Abnormalities in the liver or intestines are sometimes seen in fish such as white suckers and brown bullheads and can be caused by parasites or tumors. Concern about the potential effects of these diseases on the fish themselves, and the possible role of pollution in causing tumors in some coarse fish, has prompted ongoing investigations into these abnormalities. Growths on game fish caused by viruses include lymphocystis, dermal sarcoma, and lymphosarcoma.

Viruses infect fish skin through contact with infected fish during the spring spawning run, forming pale or white cauliflower-like growths. Lymphocystis does not kill affected fish, and tagging studies have shown that these fish can lose the growths by the following spring. There is no known health risk from consuming an infected fish once it has been skinned and cooked.

Dermal sarcoma, another viral disease affecting walleye, is caused by viruses that infect cells and cause growths just under the skin. These growths can be removed by skinning the fish.

The appearance of viral or bacterial infections in fish may be unattractive, but there is no evidence to suggest that these infections pose a threat to consumers.

Summary

Fish is a good source of protein, minerals, and vitamins and can be very healthy for you. As with many foods, you should eat certain fish in moderation. How fish is prepared, age, gender, and health are factors when choosing fish. **Use the chart on page 5 as a guide if you eat recreationally caught fish.** Recommendations are provided for store-bought/commercial (fresh, frozen, or canned fish) on page 5.

Some fish may absorb contaminants from the water where they live and from the food that they eat. The amount of these contaminants in the fish can increase over time. It is important to keep your exposure to these contaminants to a minimum by remembering four important facts:

- For sport-caught fish: larger, older, or fattier fish (e.g., catfish, carp, and bass) take in more contaminants such as PCBs.
- Mercury is bound to the meat and not to the fat of the fish. Cooking fish can reduce some contaminants, such as PCBs, but not mercury.
- Women of childbearing age, infants, and children are more at risk from contaminated fish than men (see table on page 5).

Indiana Fish Identification

BASS
Largemouth Bass - Upper jaw extends beyond back of eye
Smallmouth Bass - Upper jaw does not extend beyond back of eye
Spotted Bass - Red eye, horizontal lines of dark spots on lower sides
Striped Bass - Tooth patches on back of tongue in two parallel patches, first stripe below lateral line complete to tail, stripes above lateral line are unbroken
White Bass - Single tooth patch on back of tongue, first stripe below lateral line not complete to tail
Hybrid Striped - Two tooth patches on back of tongue are joined, first stripe below lateral line complete to tail, stripes above lateral line usually broken
CATFISH
Channel Catfish - 24-29 rays in rounded anal fin, caudal fin is deeply forked, dark spots on sides
Blue Catfish - 30-35 anal fin rays, anal fin margin is straight, caudal fin is deeply forked
White Catfish - Caudal fin margin is nearly straight (slightly forked), no dark spots on sides
Bullhead Catfish - Caudal fin is straight
PERCH
Walleye - No spots on dorsal fin, dusky spot at rear of spiny dorsal fin, tip of lower caudal tail and anal ring are white
Yellow Perch - Back and sides with several dark vertical bars, 6-8 anal fin rays. Jaws and roof of mouth without large, prominent teeth
Sauger - 3 or 4 saddle shaped blotches on back and sides, spotted dorsal fin
SUNFISH
Bluegill - 5-9 vertical bars on sides, black opercula flat (ear) with no margin, dark spot at rear of dorsal fin
Black Crappie - 7-8 dorsal spines, random blotches on sides
White Crappie - 6 dorsal spines, black side markings from vertical bars rather than random spots
TROUT and SALMON
Rainbow Trout - Or steelhead: white mouth, teeth and gums; small black spots on back, sides, caudal and dorsal fins; caudal fin margin is square
Lake Trout - White mouth, teeth, and gums; some orange or red spots on sides, some spots enriched with light blue; caudal fin margin is square
Chinook Salmon - Or king salmon: teeth are set in dark gum; black spots on back and both lobes of caudal fin; 15-17 anal fin rays

1.800.TIP.IDNR

Turn in a Poacher/Turn in a Polluter (TIP) is a joint effort between Hoosier outdoor enthusiasts and the Indiana Department of Natural Resources (DNR) to eliminate the illegal taking of Indiana's fish and wildlife and the polluting of Indiana's environment.

TIP offers rewards for information leading to the arrest of wildlife law violators. Citizens may report violators by calling the toll-free TIP number. Callers are not required to give their names or testify in court.

TIP offers a minimum reward of \$200 for information on cases involving big game and endangered species. For other cases, the minimum reward is \$100.

Free Fishing Information from DNR

The annual Indiana Fishing Guide, distributed by the DNR, provides anglers with information on general rules and regulations, where to fish, fish identification, record fish program, special regulations for Lake Michigan and the Ohio River and public access. A copy of the Fishing Guide is available at most bait and tackle stores, or you may contact the Division of Fish and Wildlife's Indianapolis office, IGC-W273, 402 West Washington Street, Indianapolis, Indiana 46204, 317.232.4080. Information is also available online at:

www.IN.gov/dnr/.

REDUCING MERCURY IN YOUR ENVIRONMENT

In an effort to reduce mercury in Indiana's lakes, rivers, and streams and their respective fish populations, the Indiana Department of Environmental Management (IDEM) created the Mercury Awareness Program (M.A.P.). The M.A.P. was created in partnership with Indiana Solid Waste Management Districts and several Indiana cities to allow residents to safely recycle their mercury-containing items. Listed below are common household items that can be recycled through the M.A.P. program. Remember, never put mercury in the trash, down the drain, or in a burn barrel.

Common household items that may contain mercury	
Mercury Thermostats	Replace with electronic thermostats Recycle old thermostats
Mercury Thermometers	Replace with digital or alcohol (red bulb) Recycle old thermometers
Elemental Mercury	Recycle elemental mercury
Mercury Switches	Replace with mechanical or electrical switches Recycle old switches
Batteries	Replace with mercury-free batteries Recycle old batteries

For additional information on alternatives to mercury or the Mercury Awareness Program, visit our Web site at www.idem.IN.gov/your_environment/mercury or contact:
